

## Childhood Asthma in California

Rate of Asthma Hospitalization Among Children Ages 0-17: 2019; Showing Counties

**Definition:** Number of hospital discharges for a primary diagnosis of asthma per 10,000 children ages 0-17, by age group (e.g., in 2019, there were 14.8 asthma hospitalizations per 10,000 California children ages 0-4).

**Data Source:** California Breathing, tabulation of data from the California Dept. of Health Care Access and Information (Dec. 2021).

Rate of Asthma Hospitalization Among Children, by Age Group California

**Definition:** Number of hospital discharges for a primary diagnosis of asthma per 10,000 children ages 0-17, by age group (e.g., in 2019, there were 14.8 asthma hospitalizations per 10,000 California children ages 0-4).

### What It Is

On kidsdata.org, estimates of lifetime asthma prevalence are derived from reports of children ages 1-17 being told by a doctor that they have asthma. The number and rate of asthma hospitalizations—which reflect the most severe asthmatic episodes—also are provided for children ages 0-17, by age group.

### Why This Topic Is Important

Asthma is one of the most common chronic diseases among children in the U.S. and a leading cause of pediatric hospitalization. It also is the top reason for missed school days, accounting for more than 5.2 million absences annually. Asthma affects around 6 million children nationwide, at an average annual health care cost of more than \$1,700 per child.

Asthma rates vary by region, demographics, environment, physician diagnostic practices, and access to care. Although identifying the impact of independent risk factors for asthma is difficult, children of color and those from low-income families are at disproportionately high risk for severe symptoms, missed school days, and hospital visits due to asthma. In particular, African American/black and Puerto Rican children experience a greater asthma burden compared with white children in the U.S.

Asthma can be life-threatening when it is not managed properly. The CDC estimates that approximately 40% of children with asthma do not have their disease under control. Symptoms can be managed with regular medical monitoring and personalized action plans that help children use medicine as prescribed and to avoid asthma triggers. However, children who face difficulty accessing quality health care are less likely to have well-controlled asthma.

### How Children Are Faring

In 2019-2020, an estimated 12% of California children ages 1-17 had been diagnosed with asthma at some point in their lives, down from 16% in 2005. While asthma does not result in hospitalization for most children, there were 7,670 hospitalizations for asthma among children ages 0-17 statewide in 2019, a rate of 8.3 hospitalizations per 10,000 children. Rates of asthma hospitalization are higher for children ages 0-4 (14.8 hospitalizations per 10,000 in 2019) than for older children ages 5-17 (6 per 10,000 in 2019). Across counties with data, 2019 asthma hospitalization rates among young children ages 0-4 ranged from fewer than 5 per 10,000 to more than 35 per 10,000.
