Student Gang Involvement in California

9th Graders Who Consider Themselves Gang Members: 2017-2019; Showing Counties
Students Who Consider Themselves Gang Members, by Level of School Connectedness: 2017-2019

What It Is
On kidsdata.org, indicators of gang involvement come from the California Healthy Kids Survey and California School Staff Survey; data are based on:
- Student reports of gang membership by grade level (7th, 9th, 11th, and non-traditional programs), gender, level of school connectedness, parent education level, race/ethnicity, and sexual orientation
- School staff reports of the extent to which, at their school (elementary, middle, high, or non-traditional), student gang activity is a problem

Why This Topic Is Important
When youth feel disconnected from family, school, community, or future work possibilities, they may view gangs as viable opportunities for support, respect, protection, or income. While youth involved in gangs comprise only a small portion of the adolescent population, they are disproportionately involved in violent crime—both as perpetrators and victims. Youth involved in gangs also are more likely to drop out of school, abuse substances, engage in high risk sexual behavior, and experience other long-term problems such as employment instability. The effects go beyond those directly involved, as well. Communities also can be affected in terms of reduced quality of life, increased crime, families moving out of neighborhoods, and economic costs, e.g., losses in property values, local businesses, and tax revenue.

In 2019, 9% of U.S. students ages 12-18 reported a gang presence at their school. When youth are exposed to violence or feel unsafe at school, it can negatively affect their health, mental health, and academic performance. Because the majority of youth who join gangs do so between the ages of 11 and 15, early prevention among children is critical, along with cross-sector efforts that strengthen families, schools, and communities.

How Children Are Faring
In 2017-2019, around 1 in 25 California 7th, 9th, and 11th graders considered themselves gang members, down from more than 1 in 15 in 2011-2013. Students in non-traditional programs, students with lower levels of school connectedness, male students, and students whose parents did not finish high school are more likely to be involved with gangs than their peers in other groups. Asian youth had the...
lowest rates of gang involvement (2%) among racial/ethnic groups with data in 2017-2019, while African American/black and American Indian/Alaska Native youth had the highest (6%). Estimates of gang membership also were higher for gay, lesbian, and bisexual students (6%) when compared with straight students and those unsure of their sexual orientation (4%).

School staff reports from 2017-2019 show that gang-related activity was a moderate or severe problem according to 2% of responses by elementary school staff, 9% of responses by middle school staff, 12% of responses by high school staff, and 28% of responses by non-traditional program staff statewide.
